Co-financing sanitation
Patel 2015

2010

The WSP tools offer the **clearest framework** and systematic view for understanding the complexities of urban sanitation, they take into account the enabling environment and what is do-able in context

Value chain and FSM have moved sanitation “beyond the toilet”, increasing specialisation, tools and techniques.

Understand the value of **enabling environment** - *why* things are the way they are.

Where we are today?

Sanitation as a business
better techniques to generate household demand for sanitation

The sanitation chain has become the *de facto* conceptual model for urban sanitation

People centered development,
centrality of **demand**

Complex realities of **urban living**
(not just low income)

Complex urban systems - planning
for one service cannot proceed in
isolation from others

**What have
we lost?**

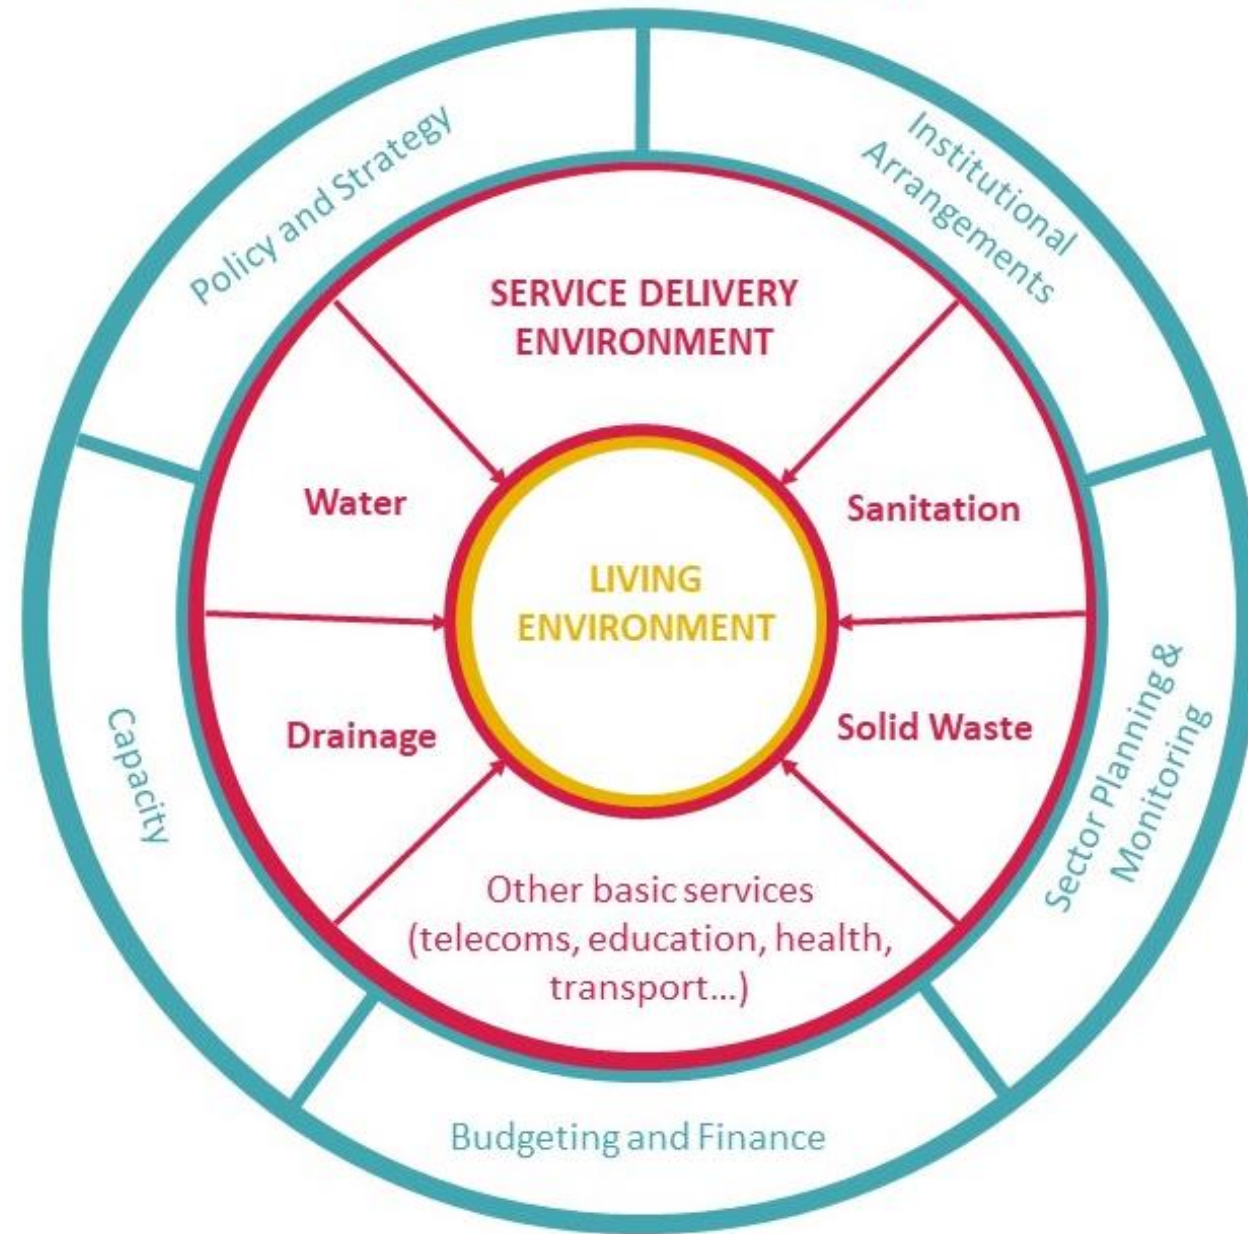

Sanitation is important - but so are
many other basic services

Where do we go from here?

- Integrate what we've learnt about urban sanitation into earlier work
- Reconsider *integrated service provision* for the peri-household environment
 - sanitation is only one component.
- Place sanitation back into the wider human-technology-environment systems of the city.

THE ENABLING ENVIRONMENT

Thanks for listening
