KCCA
KAMPALA CAPITAL CITY AUTHORITY
For a better City

An Inventory of
Community Toilets
2016

Asiimwe Abel A. Bimbona
Town Clerk, Rubaga Division | # FOREWORD

I take this opportunity to extend warm greetings from the entire KCCA family. KCCA has been undertaking an exercise of mapping community toilets in Rubaga Division. The aim of the activity was to develop a GIS database for community toilets constructed by KCCA, and Civil Society Organizations (CSOs). In turn, the database will form basis for assessment of the status of sanitation and determine challenges with existing technologies for the community toilets in Rubaga Division.

This activity took place in January, 2016 in the eleven (13) wards of: Busega, Kabowa, Kasubi, Lungujja, Mutundwe, Nakulabye, Ndeeba, Lubaga, Nateete, Najjanakumbi I, Najjanankumbi II, Namirembe and Lubya in Rubaga Division, Kampala.
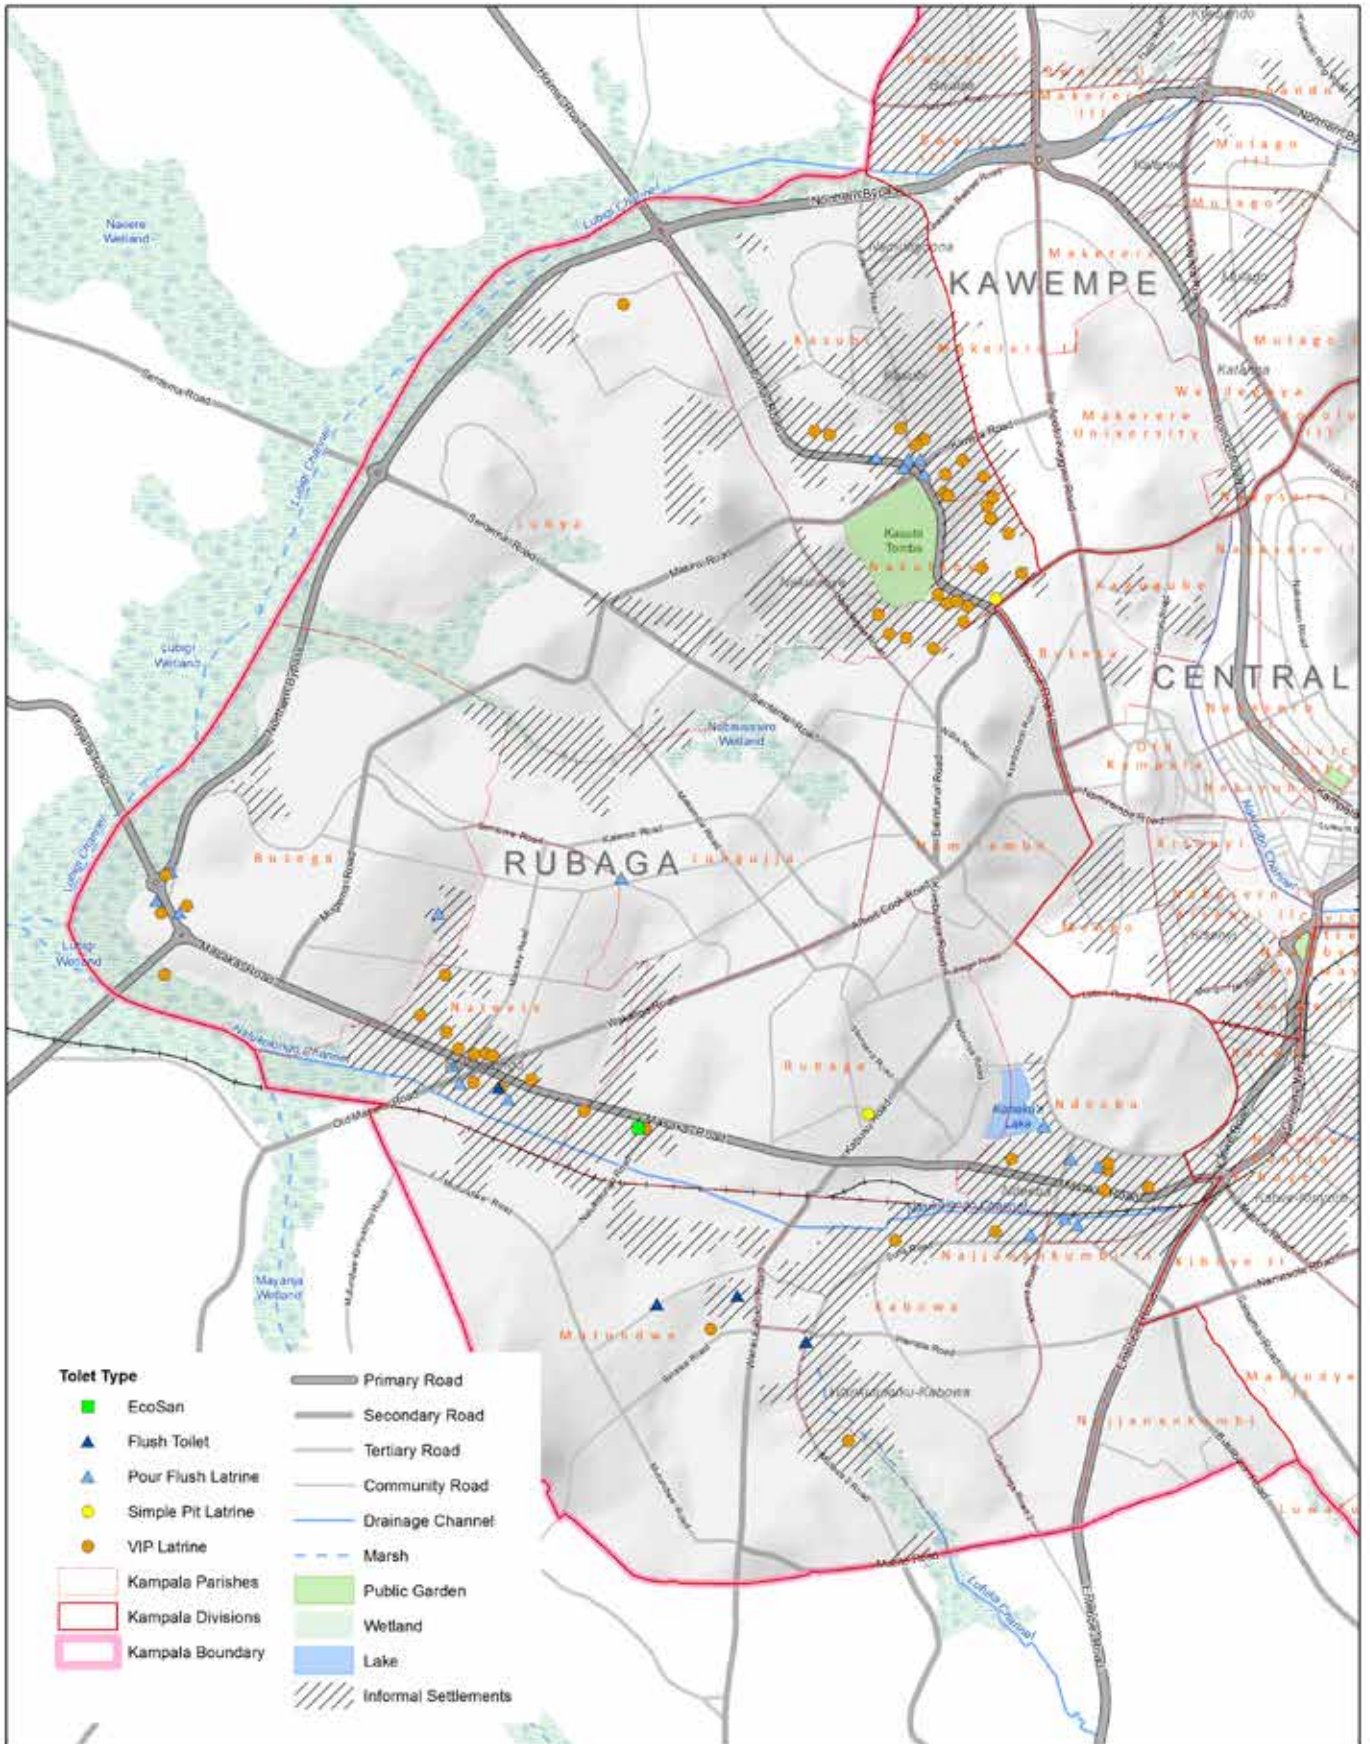

We acknowledge the support rendered by WaterAid Uganda, which provided the funds for the exercise, and GIZ/RUWASS, which gave technical support in developing the data collection tool and formulating the GIS-based WASH database.

To the Director Public Health and Environment, and the Sanitation Unit Team, I congratulate you upon the work well done.

I therefore present to you the findings of the exercise and trust that you will find this worth reading.

Asiimwe Abel A. Bimbona
Town Clerk, Rubaga Division

GLOSSARY

Community toilets are shared facilities provided by and for a group of residents or an entire settlement.

Epicollect is an online application for android and iphone systems using online cloud services for uploading the data collected in the field.

1.0   INTRODUCTION

Kampala city has a population of 1.5 million people with an estimated day population of 3.5 million. On average, two million people move through the city and need to use public/community sanitation facilities.

Section 35 of the KCCA Act 2010 mandates KCCA to provide safe sanitation facilities in communities. While fulfilling this obligation, KCCA and partners have constructed about 560 sanitation facilities in communities. These facilities were sited according to demand for sanitation services, population distribution, poverty levels, nature of settlement and availability of land to mention but a few. In most cases, the funds used to construct community toilets are secured from Government of Uganda and development partners. Civil Society Organizations are the major source of funding for community toilets in Kampala followed by Government of Uganda.

Management of sanitation facilities has both software and hardware requirements. The hardware component refers to the state of the physical structure of the toilet and its appliances necessary for safe handling of human waste. The software component refers to the management of use of the facilities and the social behavioral aspects around the sanitation facility.

Section 55 of the Public Health Act 2000 requires KCC to maintain a clean and sanitary condition in the area of its jurisdiction (Kampala City). In order to fulfill this requirement, KCCA must have interest in the management of sanitation facilities in the city. The first step towards this is having an inventory of the community toilets in the city. In the period of 12th January to 16th January 2016, all community sanitation facilities in Rubaga Division were mapped and information about their management taken. The survey team also collected information about the general state of the structures of these facilities.

2.0 GUIDELINES TO MANAGE A COMMUNITY TOILET IN KAMPALA

Community toilets are shared facilities provided by and for a group of residents or an entire settlement. Community toilet blocks are used primarily in low-income and/or informal settlements/slums, where space and/or land are constraints in providing a household toilet. These are for a more or less fixed user group. These are managed by a user committee.

Community toilets are usually constructed with funds from the Government of Uganda, its partner organizations such as Civil Society Organizations, Community Based Organizations and entities with an aim of enabling the community to access sanitation services. The structure can be located on public land or private land. In case the facility is located on private land, the landlord/bonafide occupant (Kibanja Owner) consents that the land where the facility is located remains a sanitation facility for public use for a period of not less than twenty (20) years from the time the facility is handed over to the community for use.

A Memorandum of Understanding (MoU) or an agreement between KCCA and the landlord/bonafide occupant is always signed before construction commences. The MoU or Agreement should clearly indicate that the landlord/bonafide occupant must not demolish, fence off (with an intention of using the facility privately) or prevent use of the facility by the community members.

Community toilets are always managed by members of the Toilet User Committee (TUC) or the toilet manager who is appointed by TUC.

2.1 Guidelines on establishing a community toilet

The following steps must be undertaken to establish a community toilet in Kampala:

1. **Identification of land:** it is recommended that local leaders should play a lead role for this process.
2. **Establishing land ownership:** The local leaders should establish the true owner of the land and whether the owner is willing to commit the site for sanitation use for the next twenty years.
3. **Suitability of the land:** The KCCA engineer should visit the site to determine its suitability and recommend the type of sanitation technology to be explored. A suitability report should be prepared to this effect.
4. **Selection of Toilet User Committees (TUC):** This should be done in close supervision of the town clerk or the agent.
5. **Commitment of TUC and Landlord:** A MoU/Agreement between the landlord and KCCA should be signed. TUC also commits to manage the toilet on behalf of the community. The mode of management of the facility should be clearly stated/described in the agreement.
6. **Construction of the facility:** KCCA must approve the plan for the structure. Drawings and the concept are presented to KCCA for approval. KCCA continues to provide technical support.
7. **Commissioning of the project:** On completion of the facility to the satisfaction of the users, the facility will be transferred to the Toilet User Committee for management.
8. **Management of a Community Toilet by the TUC:** A community toilet is managed by the Toilet User Committee (TUC) comprised of the Chairperson, Treasurer, Secretary, landlord, Village Health Team member, Chairperson Local Council I and Ward Administrator of the area where the toilet is located. TUC may appoint a toilet manager to oversee the day to day running of the facility.

The Ward Administrator, the Chairperson LC I and the Toilet Manager are ex folio members of the committee.

Ex folio members of the committee do guide members in decision making but don't participate in democratic decisions about management of the toilet. The chairman of TUC will also be a member of Ward Health Team.

The Ward Administrator and/or the Division Sanitation Officer will preside over the election of the TUC members. Only registered users will participate in electing committee members. Registration of users will always be done at least a week before the election of office bearers. The register of users should be shared with the Ward Administrator and the Chairman of the Ward Health Team.

Below is the management structure of the community toilet:

Ward Health Team

⬇

Toilet User Community

⬇

Toilet Manager

⬇

Toilet User

2.2   Responsibilities of Toilet User Committee (TUC)

Below are the responsibilities of the Toilet User Committee (TUC):

- **Setting up the user fee:** User fees are used to pay attendants, provide toiletries, security to the premise, payment of utility bills and for emptying of the toilets and renovation of the toilet. TUC determines the method of collection of fees. All children below 18 are allowed to access a community toilet at no fee. User fees should not exceed the recommended rate by KCCA.

- **Selection of the toilet manager:** The toilet manager shall present his request to manage the toilet to TUC, with a methodology clearly stipulating how he/she intends to keep the facility to the recommended standards of the Public Health Act and guidelines. Guided by democratic principles, TUC shall select a toilet manager whose term of office shall not exceed six months. The period of engagement shall be renewed with consideration of his performance in the previous term. The toilet manager runs the day to day affairs of the toilet on behalf of the toilet user committee. He is responsible for the collection of user fees, ensuring that toiletries are available, utility bills are paid and the toilet is emptied when full.

- **Renovation of the facility:** The facility must undergo major civil renovation every three years. Users must contribute to the cost of renovation of the facility. Minor renovation works and replacement of broken equipment such as taps and locks should be done by the toilet manager with advice from the user committee.

- **Promotion of good sanitation and hygiene practices:** The committee is responsible with promotion and ensuring adherence to good sanitation and hygiene practices by users. Committee members should be exemplary and take lead in sanitation and hygiene promotion activities in their communities.

- **Preparation of performance reports:** A monthly performance report must be submitted to the Ward Administrator of the ward in which the toilet is located. This performance report will also include accountability for the funds collected. The Ward Administrator shall compile a sanitation performance report to the Division Medical Officer. The Toilet User Committees' term of leadership shall be two years. All members of TUC must be adults of age not less than eighteen years.

2.3   Mode of collection of funds to run the toilet

Funds to manage the facility can be collected from users by one of the following methods:

- **Pay per use method:** The users of the facility pay a nominal fee to the toilet manager each time they want to access the facility. The nominal fee rates are determined by the Division Health Team.

- **Periodic payment method:** The TUC decides on period, not greater than a month, after users or household pays to the toilet manager an amount as guided by the Division Health Team. The time periods can be a week or a month.

2.4   Use of the funds collected from users

Funds collected from users are used to pay:

- Utility bills (water, sewerage and electricity)
- Salary/wages to the attendants
- Purchase of toiletries
- Purchase of cleaning equipment
- For emptying of the facility
- Servicing of plumbing system
- Renovation of the facility
- Replacement of faulty parts such as taps

Upon use of funds, the toilet manager and the treasurer prepare a financial report with attached accountabilities stipulating income and expenditure on a monthly basis. The financial performance report should be presented to the Ward Administrator for approval before being presented to the Division Medical Officer.

2.5   Monitoring and evaluation of the performance of the community toilet

The toilet manager (supervised by the TUC) will ensure that the toilets are meeting the public health standards for sanitation facilities. The toilet manager will be supervised by TUC. At the end of every three month period, TUC will submit a performance report to the office of the Division Medical Officer. The Ward Administrator and the Division Medical Officer will monitor the performance of TUC and the toilet manager.

3.0   PROFILE METHODOLOGY

3.1   Data collection tools and training

With technical support from GIZ/RUWASS, the data collection tools were developed, pretested and reviewed by technical officers of KCCA. A team of ten research assistants were trained in data collection of WASH related research and use of Global Positioning System (GPS) devices. The GIS based WASH database was linked to the EpiCollect online interface (http://tinyurl.com/pz453pp) so that data collection would be monitored both in the office and in the field.

3.2   Data collection

Research assistants were sent to the field for data collection using an online questionnaire installed on mobile phones. Each questionnaire that was entered was sent straight to the system and the particular facility was mapped right way. This enabled data quality through monitoring the data collectors. The teams worked with Village Health Team members and Local council I leaders for each zone to identify the sanitation facilities.

3.3   Data analysis

The collected data was cleaned and entered in the WASH database which shows the location of each facility, name of the care taker and state of the facility. The collected data showed the following distribution characteristics for the community WASH facilities in Rubaga Division.

3.3.1 Toilet technologies distribution

Rubaga Division has a total of 81 community toilets and these comprise of five toilet facility technologies. The Ventilated Improved Pit (VIP) latrines are the most used community toilets at 67% while Ecological Sanitation Toilet (EcoSan) are the least used. It was also noted that all EcoSan toilets are used as shallow lined pit latrines.

Figure 1: Community Toilet Technologies
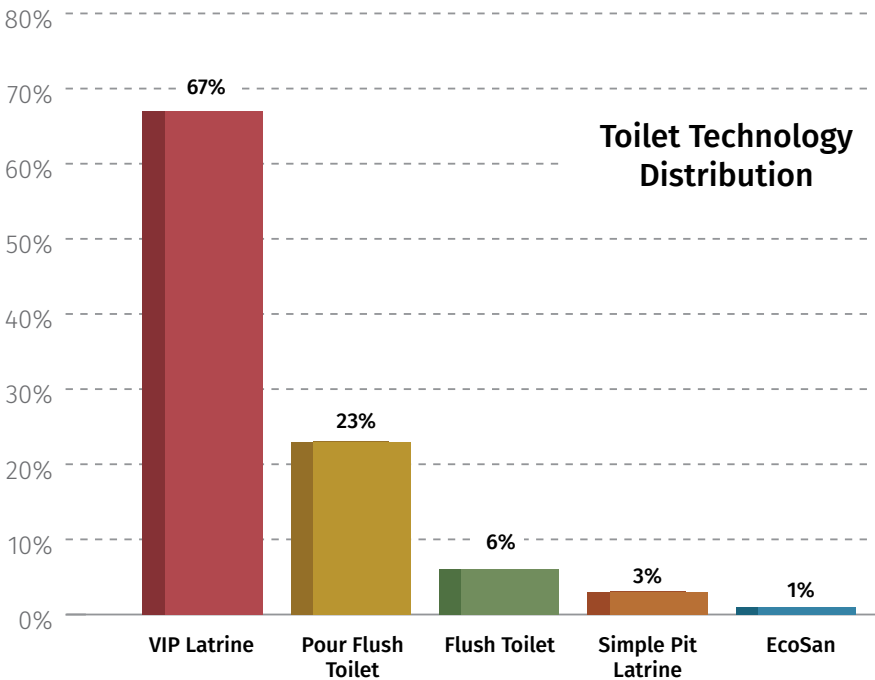

3.3.2   Funding for construction of the community toilets

Funds for construction of community toilets usually come from Central Government and the Civil Society Organizations. CIDI (at 22%) is the major financing body for community toilets in Rubaga Division and it is followed by KCCA at 16%. Figure 2, shows the organizations which have funded construction of community toilets in Rubaga Division.

Figure 2: Financing agencies for community toilets
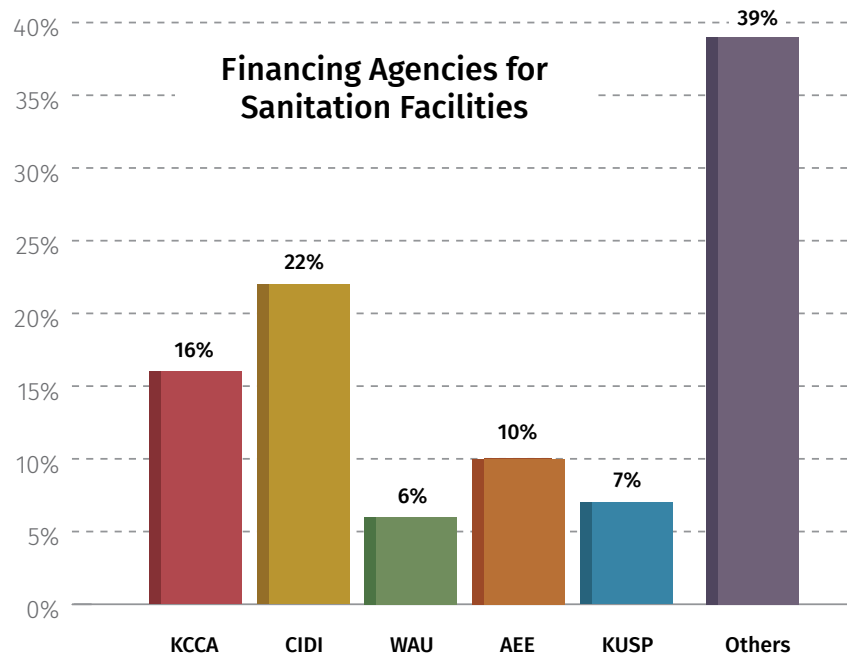

3.3.3 Usage of the toilets

A proportion of 4.94% of the community toilets in Rubaga Division are not in use due to the poor hygienic and structural state. These toilets are in a poor hygienic condition because the care takers are not given the cleaning equipment and toiletries by the toilet user committee members. Most of the toilets did not have toilet user committees and hence were being managed by landlords.

Figure 3: Community Toilet Usage Status
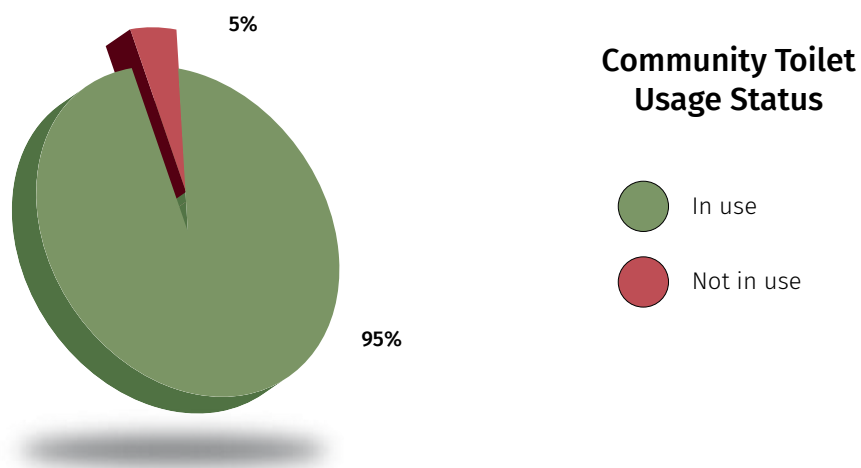

3.3.4 Level of cleanliness of the toilets

For the purposes of this exercise, cleanliness of a facility was limited to dryness of the floor, absence of litter and faecal matter on floor, absence of foul smell, walls and roof free of cobwebs and faecal smear. 48% of the facilities were found dirty at the time of the survey.

Figure 4: State of Cleanliness of Community Toilets
3.3.5 Hand washing provision

Most of the facilities (50.6%) had no provision for hand washing. This was a design error for these facilities. Only 37% of the facilities were found to have a provision for water and soap in use. Figure 5 shows the distribution and state of hand washing facilities for community toilets in Rubaga Division.

Figure 5: Distribution and state of hand washing facilities
3.3.6 Faecal storage after super structure of the toilets

Most (70%) of the facilites had faecal matter stored in a pit waiting for emptying. The biggest part of Rubaga division is not connected to the sewer line hence the reason for onsite sanitation systems being the most popular.

Figure 6: Faecal Deposition in Substructure

Faecal Storage Type

30%

70%

- Pit
- Septic Tank
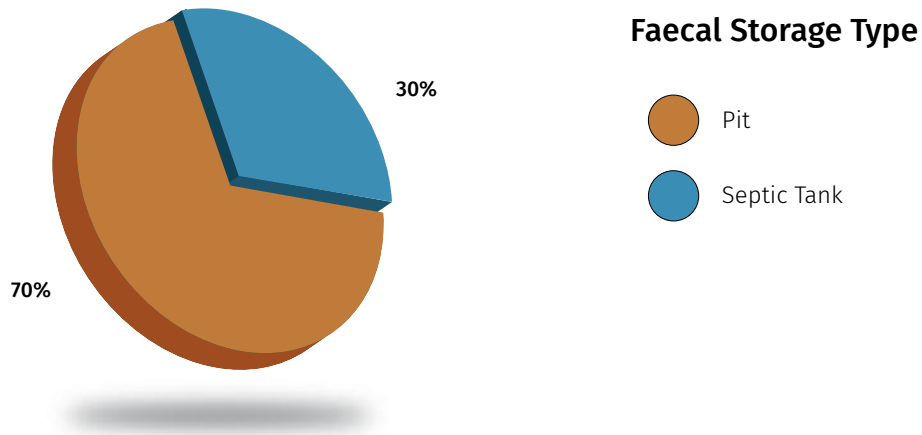

3.3.7 Emptying the toilets

The most common method of emptying community toilets is by use of a cesspool emptier. The faecal sludge from toilets is taken to the National Water and Sewerage Cooperation treatment plant at Lubigi. Money collected from toilet users facilitates the emptying service. However it was found that 40% of the toilets were full and needed emptying services. KCCA provides a free extra trip as bonus for every trip paid by the community however the toilet managers were not aware of this offer.

- Full
4.0   COMMUNITY TOILET TECHNOLOGIES

Simple Pit Latrine

Simple Pit Latrines are the most basic form of recommended latrines.

They consist of a lined pit to prevent seepage of effluent into the surrounding soil, a slab or platform on which to stand, and a shelter to provide privacy and protection from the elements.

Simple pit latrines may suffer from bad odours and an abundance of flies. They should be fitted with an air vent and an appropriate cover to place over the drop hole when not in use.
Ventilated Improved Pit Latrine (VIP)

Ventilated Improved Pit (VIP) Latrines are the most common latrine type in Rubaga Division, offering advantages over a simple pit latrines in terms of a reduction in bad odours and flies.

VIP latrines feature an additional vent pipe fitted directly to the pit. Air circulates through the air vent in the shelter, into the pit, and out through the vent pipe, reducing the bad odours in the shelter.

In addition, the vent pipe is fitted with a mesh. Because the drop hole is covered when not in use, and ambient light in the shelter kept to a mimimum, flies fly up the vent pipe towards their only source of light. They are trapped by the mesh and eventually die.

Jug with
water for
flushing

U-Bend pipe
Pour Flush Latrine

Pour Flush Latrines use a waste pipe with a U-bend or siphon. This acts as a seal, preventing odours and flies from traveling back from the pit into the shelter.

Pour flush latrines must be flushed after each use, and therefore are heavily dependent on a steady and readily available supply of water. This can be 'grey' water recovered from washing clothes or dishes.

EcoSan Toilet

Ecological Sanitation Latrines (EcoSan) are designed to separate urine from faecal matter.

The advantages of this process are various. In the absence of urine, faecal matter dries more quickly. This reduces not only odours, but also the amount of pathogens in the waste matter, providing a safer facility for users.

In addition, dried urine and faecal matter can be reused for agricultural purposes, as soil amender and nutrient-rich fertilizer.

EcoSan toilets do not require any water for their operation (aside from cleaning), but it is recommended that users add a drying agent after use, such as soil, ash or sawdust.

Flush Toilet

If properly maintained, **Flush Toilets** provide a hygienic and pleasant experience for users. Available both as sitting (pictured) and squatting toilets, they are often found in commercial premises such as shopping malls, hotels and restaurants, and of course private houses. With each flush using approximately 10 litres of water, they are heavily dependant on a steady and reliable water supply and are therefore best suited to areas where connection to mains water is possible.

Vacuum Tanker Truck

Gulper

CESSPOOL EMPTIER
Emptying a pit or septic tank

All pits and septic tanks will require periodic emptying. It is therefore important that they are constructed in such a way as to allow access, by incorporating a manhole cover or inspection cover.

Tanks can be emptied by a vacuum tanker truck or, in the case of smaller tanks, by a gulper. Pits and septic tanks should never be emptied manually as doing so presents serious health risks.

Once emptied, the faecal sludge is taken to the National Water and Sewerage Corporation treatment plant at Lubigi. Pit and septic tank emptying services are provided by KCCA and several private sector organizations, shown on the following page.

5.0 INVENTORY OF COMMUNITY TOILETS IN RUBAGA DIVISION

The information here is aimed at guiding officers who do the monitoring of performance of the community toilets with information about location, type and toilet manager.
Note: Three wards in Rubaga Division do not have community toilets. These are Najjanankumbi I, Najjanankumbi II and Namirembe.

5.1 Busega Ward

The ward has 9 community toilets as detailed in the table below and map on the next page.

| Toilet Id	Toilet Name	Zone	Manager	Manager Phone	Toilet type	Status
R018	Mr. Tamusuza Joseph	Kigwanya	Mr. Tamusuza Joseph	0705691633	Pour Flush Latrine	In Use
